

melting...

As a photographer deeply moved by the urgency of the climate crisis, I humbly present this portfolio titled 'melting...' as my contribution to the call for action. Through visual storytelling, I aim to bear witness to the impacts of climate change, capturing scenes from the majestic Arctic glaciers to Hokkaido's enchanting drift ice, two sides of the Earth united by a common threat.

Each photograph serves as a testament to the fragility of our planet's ice formations, highlighting the urgent need for action. Capturing the ethereal beauty of ice caves within glaciers, I am struck by the looming threat: the rapid disappearance of these landscapes due to rising temperatures.

With every click of the shutter, I endeavour to translate scientific data into emotive imagery, bridging the gap between statistics and human emotion. The stark reality is that glaciers worldwide are retreating at an alarming rate, with Arctic ice diminishing by approximately 13.1% per decade.

This project transcends mere documentation; it embodies my belief in the power of art to inspire change. By inviting viewers to immerse themselves in the exquisite details of each frame, I hope to spark dialogue, cultivate empathy, and ignite a sense of urgency in the fight against climate change.

Join me on this global journey of contemplation, resilience, and hope. Together, let us use the potency of photography to amplify the voices of our imperilled planet and strive towards safeguarding the future for generations to come.

Jökulsárlón Glacier

64° 4' 36.1056" N

16° 13' 47.3772" W

“The rock beside me bears the date 22/05/2023,
marking the former entrance of the glacier.
The route from here, once a path through the
glacier, has vanished within a year.”

— Glacier Guide from Blue Iceland | 30/03/2024

How many days can we still keep this?

In the 1920s, the Breidamerkurjökull Glacial Tongue started to melt and retreat due to uncharacteristic rising temperatures.

The lake is essentially the melted glacial water.
